Pulmonex™ II Xenon System

Double the breathing capacity of other systems

- Resistance-free breathing with 25-liter capacity
- Complete 1/8" lead shielding in upper cabinet for patient and operator safety
- Easy access to replace Drierite and Soda-Lime cartridges
- Effortless mobility for easy patient positioning
- Stylish steel cabinet
- Convenient built-in stainless steel tray for holding disposables, xenon gun, syringe etc.

Resistance-Free Breathing

- The injected bolus of xenon will reach the patient exactly when desired
- Oxygen may be added to the system any time during the study with the press of a button
- An in-line cartridge containing Soda-Lime absorbs CO², preventing acidosis.
- Large breathing passages, two 10-liter breathing bags (air-in and air-out) and motor-assisted airflow combine to provide resistance-free breathing

Simple to Operate

- All three steps of a Pulmonex II study (start up, equilibrium imaging and washout) are controlled by a single valve handle on the front panel
- The valve directs the motor-assisted flow of gases throughout the system
- A manually adjusted 15-minute timer initiates all functions, then automatically shuts down the system to complete the study after patient and system washout
- With controls conveniently located on the front panel, the user can operate the system and observe the patient and gamma camera from one position
- Panel controls are clearly marked for each mode of the procedure with large viewing windows to make it easy to monitor the patient's breathing
- A trim, clean design, large handles and total mobility permit easy positioning of the system for studies in both seated and supine positions

Convenient Fold-Down Tray

Designed for Safety

- Internal systems of the Pulmonex II are shielded for patient and operator safety
- The system features two built-in gas traps that operate with a blower fan
- Exhaled xenon is pulled through activated charcoal housed within two 1/8" lead shielded "U"-shaped traps
- The double traps extend the life of your charcoal and provide a lengthy migration path for xenon effluent, allowing greater decay and absorption before exhaustion
- A cartridge containing Drierite serves as a moisture absorber for air passing into the trap; the charcoal trap can then more effectively remove xenon effluent after each study
- Airflow regulation of the trap blowers assures complete patient and system washout
- Averaging 30-50 studies per month, the charcoal trap will last approximately one year; charcoal traps are easily replaced
- A disposable bacteriostatic filter, used in conjunction with a disposable mask or mouthpiece, prevents system contamination

Easy access to Soda-Lime and Drierite cartridges, supplied with the system. Xenon Convenience kits, including pre-filled Soda-Lime and Drierite cartridges for single use only, are also available on page 100

Venti-Scan™ IV Radioaerosol Delivery System

The Venti-Scan IV provides greater protection and uses a special disposable Radioaerosol Convenience kit for greater trapping efficiency and unrestricted breathing.

- System design reduces set-up time:
 - kit automatically locks into position
 - one step oxygen connection to dedicated external port
 - precise injection port alignment
 - push button disposal of used kit
- Fully enclosed lead shielding from top to bottom
- Contour filter for increased trapping efficiency and resistance-free breathing
- Trapping efficiency greater than 99.9%
- Small baffle design ensures homogeneous distribution
- Mean particle size = 0.50 microns
- Lightweight and portable, weighs only 8 lb

Sharp Clear Images- Easy Breathing

- The Venti-Scan IV Radioaerosol Delivery System features a small baffle within the nebulizer to produce an optimal particle size, resulting in a sharp image, quickly.
- The kit includes a pleated hydrophilic filter which traps moisture making it ideal for radioaerosol studies by impeding the exhaled radioaerosol particles from passing through. The pleated contour increases surface area to decrease breathing resistance, making it virtually resistance-free with exceptional trapping efficiency.

Full Technologist Protection

- The Venti-Scan IV shield is an enclosure providing lead-shielded protection from top to bottom.
- The Venti-Scan IV Disposable Kit includes everything needed for a single study including a comfortable, natural contour mouthpiece, filter, nose clip and disposable bag.
- The top of the canister has a shielded sliding port to accommodate the Venti-Pak Accessory Kit for ventilator-assisted patients. An IV pole mount is included with the shield for convenient positioning and administration.

1 Insert Venti-Scan IV Kit in canister

2 Inject Tc-99m DTPA

3 Connect to O₂ supply; position patient comfortably for resistance-free breathing

AeroTech™ I Radioaerosol System

The original Cadema Radioaerosol System

Aerosol inhalation for radioimaging studies is an important tool for use in the localization and diagnosis of lung disease. AeroTech I puts information in the hands of the user to assist in diagnosis of a variety of lung diseases.

- Enhanced Imaging
- Multiple views from one diagnostic study
- Completely portable and respirator compatible
- Completely Shielded

Enhanced Imaging

- Delivers an even distribution of radioaerosol throughout the lungs, reaching the respiratory bronchioles and alveolar ducts and sacs.
- Excellent aerosol deposition allows the acquisition of multiple views from each diagnostic study.
- The end result is high quality imaging for confidence in patient diagnosis.

Respirator Compatible

- Easily adapted to fit on line using a single accessory tube

Designed for Patient Comfort

- Aerosol inhalation studies allow the patient to breathe normally throughout the procedure, minimizing the likelihood of patient non-compliance.

Superior Safety

- Shield construction, disposable components and rapid aerosol delivery time combine to minimize radiation exposure to the patient and technologist. AeroTech I helps meet ALARA radiation protection objectives.

Flexibility

- Available with a choice of designs
 - The CA-1324 Delivery System generates a smaller MMAD particle than the standard CA-1124 Delivery System
 - Use the CA-1324 model for procedures where delivery time is not significantly restricted

The DMS-3000 is a versatile, lightweight, ergonomically-designed instrument used with an external detector for Alpha, Beta, or Gamma radiation survey. Three modes of operation – RATE, MAX, and COUNT – are available for the user. Measurements can be collected in two sets of units (primary and secondary) for RATE and MAX modes in cps, cpm, Bq, dpm, mR/hr, or $\mu\text{Sv/h}$ units. The user can switch between two sets of chosen units by simply pressing the Units button.

An internal switch is used to enable or disable the front-panel setup feature to protect desired settings from inadvertent modification. Setup is also available via software available from Ludlum Measurements. User-adjustable settings include calibration constant, dead time correction, efficiency, high voltage, pulse threshold, response time (fast or slow), count time, operational modes, HV current overload level, operational mode (Rate, Max, or Count), and minimum and maximum display levels. The user may also set Primary and Secondary units, unit alarm levels, count units, count alarm levels, and zero pulse protection time limit.

This instrument features a large, easily-readable LCD (liquid crystal display), a piercing audio warning tone, and easy, intuitive, user-friendly design. Splash-resistant construction allows the Model 3000 to be used outdoors. The unit body is made of lightweight, durable, high-impact plastic. The Model 3000 is shipped ready to use with batteries and calibration certificate.

Parameters are protected under a calibration cover. Calibration is easily accomplished by moving the cal dipswitch to the right, and using the pushbuttons to increment or decrement the calibration constant, dead time correction, and alarm point parameters. Parameters are stored in non-volatile memory (retained even with power disconnected). A five-decade logarithmic analog output is provided. A battery backup provides 48 hours of additional use after the primary power is removed.

Surface / Waste Contamination Monitor

- Excellent Surface Contamination Screening Tool for:
 - Small articles
 - Baggage
 - Packages
 - Medical Waste
- Affordable Digital Controller
- Dual Large Plastic Scintillator Detectors
- Programmable Alarms
- Networkable
- Battery Backup

- The Model 375P-336 is a Digital Model 375 Controller coupled to two 2753 cm³ (168 in³) plastic scintillation detectors
- These components are indoor units that are typically wall-mounted
- This simple and cost-effective solution offers a system that is easy to operate and maintain
- The controller supplies local alarms, but can also be connected to external alarms or even put onto an Ethernet network if desired
- It additionally has a 24-hour battery backup to keep the system operational in the event power is lost

Medical Application: This instrument is ideal for monitoring personnel or laundry for possible contamination in the nuclear medicine department. The monitor may also be used as a radiation contamination triage device to alert emergency department personnel of potentially contaminated patients or equipment coming into the emergency room.

Surface Contamination Inspection: Inspecting items using hand held instruments can be too time consuming in many cases. The Model 375P-336 allows a more rapid and uniform inspection by placing two relatively large sized scintillation detectors in close proximity to the incoming or outgoing articles undergoing inspection. Both detectors are continuously monitored by the digital controller so any offending item can immediately trigger an alarm. Alarm conditions can be set up to automatically halt production conveyance devices, notify the central office and even alert key personnel to initiate an immediate response.

043-772 Designed for PET

2nd Deluxe Flangeless Lid

The Flangeless SPECT Phantom and the Flangeless PET Phantom meet the requirements set by ACR. The appropriate phantoms provide consistent performance information for any SPECT or PET system. The small SPECT Phantom is an ACR recommended phantom for small field of view dedicated cardiac SPECT systems. Multiple performance characteristics of camera-based SPECT systems are evaluated from a single scan of the phantom.

On-axis and off-axis transverse line spread function may be easily measured without removing the cover plate. Measurements of full-width-half (or tenth) maximum can be readily determined, either in air or in water.

The Flangeless SPECT Phantom is used for high resolution cameras, complying to the ACR requirements.

Sources for SPECT

We supply a wide range of Attenuation Correction line sources for Single Photon Emission Computed Tomography (SPECT) studies. A SPECT image is developed by measuring a collimated radiation beam emitted from a patient's body. The radiation beam is produced by injecting a known radiopharmaceutical into the patient.

SPECT image quality can suffer from unquantified attenuation effects caused as the beam passes through tissue of varying density and thickness. A line source is utilized to produce a "control beam" that is measured concurrently with the "radiopharmaceutical beam." The two beams are integrated and patient specific attenuation is calculated.

The resulting image is of higher quality than an image produced without attenuation correction. The typical nuclides used in Attenuation Sources for SPECT studies are Gd-153, Co-57 and Ba-133. Sources are singly or doubly encapsulated in both line and point geometries. The nuclides, activities and dimensions are manufactured in accordance to OEM Camera manufacturer specifications.

Fillable Point Source Marker

SAVE TIME FOR CAMERA-TO-PATIENT ALIGNMENT

Point Source Marker is easily filled with the same radionuclide to be used in imaging procedure. Small clear plastic receptacle, 1" diameter x 1/2" thick, has a centered channel to contain the nuclide. A nylon screw-plug tightens against an o-ring completing a tight, safe seal. Marker is re-usable or nuclide can be decayed or removed. Available in sets of 4.
